Intelligent Assistive Communication and the Web as a Social Medium

Karl Wiegand Northeastern University (USA) April 11, 2014

Outline

- 1. Communication and AAC
- 2. Common Assumptions
- 3. Example Projects
- 4. Towards Social AAC

SMCR Model of Communication

- Affected by distortion to any component
- What if there is distortion from the Source?

Who Uses AAC?

- People of all ages
- Stephen Hawking and Roger Ebert
- Cerebral palsy (CP) -- 53% use AAC (Jinks and Sinteff, 1994)
- Amyotrophic lateral sclerosis (ALS) -- 75% use AAC (Ball et al, 2004)
- Paralysis, stroke, and more...

Functional Definitions

- Target users are primarily non-speaking and may have upper limb motor impairments
- Target users may also have developing literacy or language impairments

Current AAC Application

On Speed of Communication

Speech is often 150 - 200 words per minute

(Beasley and Maki, 1976)

VS.

Typical AAC is < 20 words per minute

(Higginbotham et al, 2007)

Passive vs. Active Channels

- Current AAC is relatively passive
- Intelligent user interfaces (active channels) can reduce distortion and increase speed:
 - a. User-Specific
 - b. Adaptive
 - c. Context-Sensitive

Creating More Intelligent AAC

Many systems, especially AAC, assume:

- 1. Prescribed Order
- 2. Intended Set
- 3. Discrete Entry

Assumption 1: Prescribed Order

- Users will select items in a specific order, such as the syntactically "correct" one.
- Requires lexical or semantic disambiguation
- Users do not always select items in expected order (Van Balkom and Donker-Gimbrere, 1996)
- Using AAC devices is slow (Beukelman et al, 1989; Todman, 2000; Higginbotham et al, 2007)

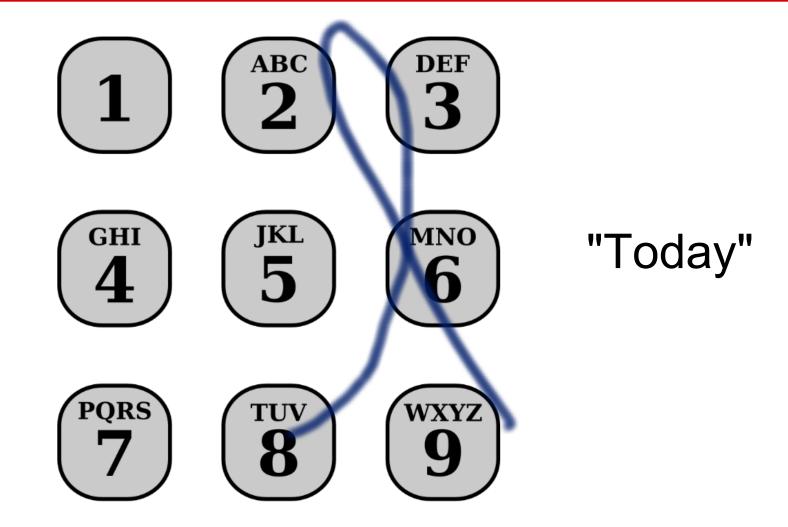

Assumption 2: Intended Set

- Users will select exactly the items that are desired -- no fewer or more.
- Complete subsets and prune supersets
- Motor and cognitive impairments may result in missing or additional selections (Ball, 2004)
- Letter-based text entry systems detect accidental and deleted selections

Assumption 3: Discrete Entry

- Users will make discrete movements or selections, either physically or with a cursor.
- Selection is important; path is irrelevant
- Recent letter-based systems have started to remove this assumption (Goldberg, 1997; Kristensson and Zhai, 2004; Kushler and Marsden, 2008; Rashid and Smith, 2008)
- Some input methods are naturally continuous

Project: NumCHAT

Project: SymbolPath

"I need more coffee."

From Assistive to Social

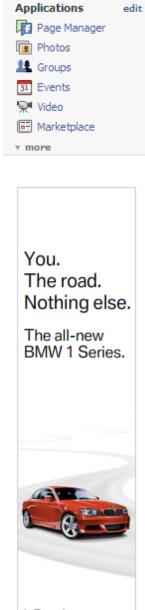

- Most AAC systems are for face-to-face interaction: slow and need-based
- What about social interaction?
- Many AAC users live at home or in small communities
- Turning to the Web to make new friends and keep in touch with family

The Web as a Channel

- Composition speed is irrelevant (sort of)
- Many social barriers go away
- Remaining issues:
 - Navigation complexity or standardization
 - Information (cognitive) overload
 - Uniform interfaces or simplification (APIs)

Ontological Engineering

- Some say, "Mobile first."
- How about, "Semantics first?" (Ha!)
- <Post>, <User>, <Profile>?
- <Message ReadingLevel=5>?
- Problems: <Ad>, <Affiliate_Link> (might as well have "display: none")

On Semantics and Wishful Thinking

TL;DL

The Web is a communication channel.

Assistive technology and Web accessibility standards can reduce noise/distortion and facilitate communication.

Sometimes for those who have difficulty communicating at all.

Thank you for listening!

karlwiegand.com/w4a2014

Special thanks to my advisor (Dr. Rupal Patel), Google, and the National Science Foundation (Grant #0914808).
